

Australia's banknotes represented a world first in currency manufacturing – they were the first full series to be printed on polymer (plastic). Polymer banknote technology was developed in Australia, jointly by the Reserve Bank and the CSIRO. The reason for introducing polymer banknotes was simple – to keep one step ahead of counterfeiters by making Australia's banknotes more secure. Polymer banknotes have the added benefit of being more durable than paper banknotes which, in turn, makes them more cost-effective.

The designs of the banknotes celebrate the diversity of Australia's social, cultural and scientific achievements.

The \$10 polymer banknote was first issued on 1 November 1993.

### Dealing with suspect banknotes

It is an offence to knowingly possess counterfeits. Suspect banknotes should be given to State or Federal police.

If you have concerns about a banknote, you are within your rights to refuse to accept it.

If you suspect a banknote is counterfeit:

- Handle it as little as possible.
- Note relevant information, such as how it came into your possession.
- Report the matter immediately to the police.

Do not take actions that may jeopardise your safety or the safety of others.

If the suspect banknote is found to be genuine, you will receive full value for it.
